

Duarte C. Barral completed the Degree in Microbiology and Genetics from the Faculty of Sciences, University of Lisbon, and the PhD in Cell Biology from Imperial College London, University of London. He was a Post-Doctoral Fellow at Brigham and Women's Hospital, Harvard Medical School until he took a position as Principal Investigator at NOVA Medical School, NOVA University of Lisbon. He is currently a tenured Associate Professor at the same School. He has been working in the field of membrane traffic and its regulation by small GTPases of the Rab and Arf families for more than 20 years. He has helped uncover the previously unknown role of several of these proteins, namely Rab27a, Arl8b, Arl13b, and Rab35. His group has been unraveling the molecular mechanisms of skin pigmentation, as well as the role of lysosomes and lysosome exocytosis in cancer progression.
